

Understanding Low Voice Input Adoption

in ChatGPT Mobile

Target Segment Selection

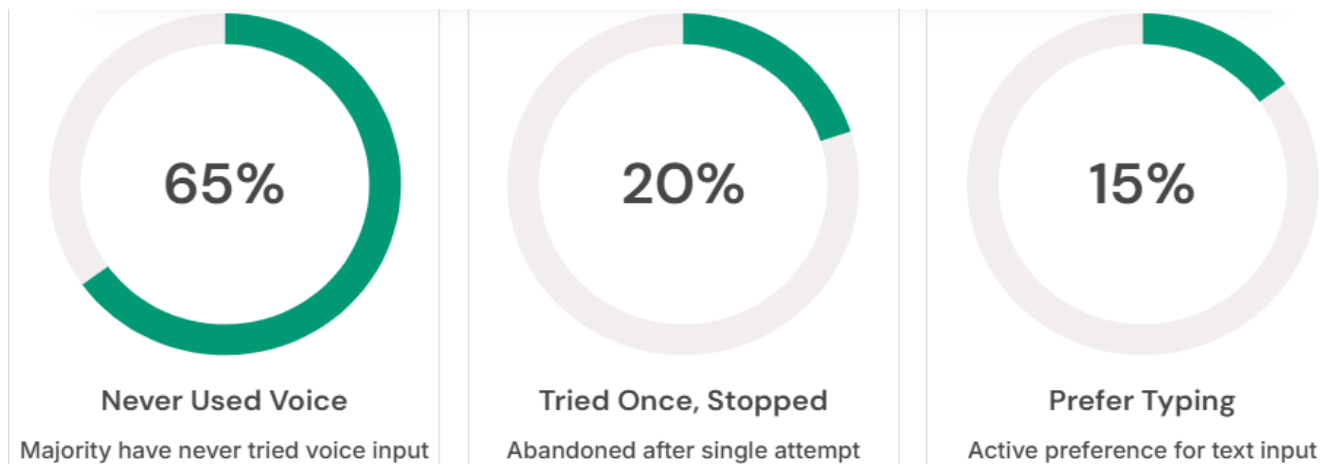

Potential Segments

Users in Public or On-the-Go Environments

- Employee(WFO)
- Student (college or school going)

People staying back home –

- WFH employee
- Job seeker
- Home maker
- Content creator

Selected Segment: PEOPLE STAYING BACK HOME

This segment frequently multitasks, has lower typing comfort, and represents a large underserved group where voice interaction could significantly improve accessibility and daily AI usage.

Why this segment?

- Largest underserved demographic in Indian households
- Lower smartphone typing proficiency creates friction
- High multitasking needs match voice's hands-free advantage
- Strong regional language usage aligns with ChatGPT's expanding language support

Key User Insights from Research

27F – Mrs. Kusum Singh

Identity: Homemaker

Pain Point: Wants to cook different cuisines using ingredients at hand, but difficult to view phone screen while cooking. Doesn't like typing much and never discovered the voice note icon.

Solution: Awareness about voice note icon

34M – Sumit Tripathi

Identity: Work-from-home employee for US-based company, works at night

Pain Point: Really wants to discuss office work with someone, but directly uses "Hey Google" instead of opening ChatGPT app

Solution: Voice assistant integration

18F – Content Creator

Identity: Content creator

Pain Point: Wants ChatGPT to create pictures and scripts easily via typing, but concerned voice input may misunderstand words and be less convenient

Solution: Improved speech accuracy for long queries

65F – Indu Devi

Identity: Speaks regional language

Pain Point: Tried ChatGPT voice note for the first time, tapped voice icon but unable to process where input was going. Out of frustration, left it

Solution: Clearer feedback during voice processing

22F – Job Seeker

Identity: Preparing for civil services

Pain Point: Needs accurate real-time answers but unable to get them. Answer framing is sometimes wrong

Solution: Better accuracy for real-time queries

Insights from Survey and Interviews

What are true problem?

1. People are not aware of voice input in Chatgpt
2. Chatgpt voice detection may misunderstand the input from the user and that led to wrong answer
3. Chatgpt don't have an assistance like "hey google ", "hey siri " , if they want to use voice input they use this assistance
4. Chatgpt get confussed when ask about the real time input

Who Faces This Problem?

Segment 1 – Users multitasking or on-the-go

Homemakers cooking

PAIN POINT:

Hard to type but **voice feature is not discovered.**

Segment 2 – Users doing work or study

Work-from-home employees

Content creators

Job seekers preparing for exams

PAIN POINT:

- They think **voice may misunderstand long or complex queries.**
- **Even while clicking the voice input icon the processing is not prominent enough and out of frustration people drop it**
- They using voice assistance like "hey google"

Value of Solving This for the Business

Solving this problem could:

- Increase **user engagement and number of prompts**
- Improve **mobile experience and retention**
- Enable **hands-free AI usage**
- Expand ChatGPT adoption in **voice-first markets like India**

Why Solve This Now?

- Mobile usage of ChatGPT is increasing rapidly
- 26 regional language in india and typing is difficult
- India has strong **voice search adoption**
- Competitors already dominate **voice interaction like google assistance**
- Improving voice could unlock **large untapped user behavior**
